Presented at the International Workshop on Space Data Systems (Inwsds), Washington, D.C., 19-21 Jan. 1982.

The functional segments that constitute the processing and data communication resources planned for the Brazilian complete space mission are presented. These segments are characterized by eight functional parts: (1) space control data network system - REDACE System; (2) ground station supervision; (3) payload ground data acquisition and routing; (4) distributed processing in the Earth stations; (5) missions control center; (6) mission operations center; (7) mission center; and (8) on board data handling. The development of these resources are significantly based on the application of distributed processing to local systems and networks.

High-Level Spacecraft Charging Environments Near Geosynchronous Orbit.
Environmental research papers,
E. G. Mullen, and M. S. Gussenhoven. 11 Feb 82, 49p Rept nos. AFGL-TR-82-0063, AFGL-ERP-771

High-level spacecraft charging events in sunlight are discussed and statistically analyzed to determine environmental parameters critical to charging and the region of space near geosynchronous altitude where charging occurs. Significant levels of spacecraft charging are shown to occur only between 1900 LT and 0900 LT at any altitude or latitude of the SCATHA satellite orbit. High-level charging is shown to occur only during periods when the magnetic activity index is 2+ or greater. Distribution functions of energetic electrons and ions are presented for 3 high-level charging periods on days 114, 241 and 363, 1979. Moments of the distribution functions are determined, and fitting techniques used to derive two-Maxwellian densities and temperatures are discussed. Results are provided in a format usable in satellite design specifications.

Filter Failure Detection for Systems with Large Space Structure Dynamics.
M.S. Thesis.
C. R. Carignan. Jun 82, 107p NASA-CR-169146, NAS 1.26:169146
Contract NAG1-126

A failure detection filter is applied to the detection of actuator and sensor failures on a free-free beam. Computer simulation tests are used to verify the filter design and study the effect of unmodeled modes on filter performance. In actuator tests, the failure signal to spillover noise ratio was found to be greatest when the filter bandwidth was 5 rad/sec beyond the input frequency. Observation spillover, however, was found to vary widely in tests run under similar conditions (same input frequency and filter poles) but with different detector gains. In sensor tests, the maximum signal-to-noise ratio for varying filter bandwidth depended upon the initial conditions placed on the unmodeled modes; the performance was good even for initial amplitudes on the first unmodeled mode 7.5% of that on the last modeled mode.

Prelaunch Estimates of Near Earth Satellite Lifetimes Using Quasi-Dynamic Atmosphere Models - Application to a Proposed Brazilian Satellite.
N. S. Venkataraman, and K. R. Rao. Feb 82, 22p INPE-2325-PRE/080
Submitted for Publication.

A rapid prelaunch estimate of near Earth satellite lifetimes using the small perturbation theory is calculated. A quasi-dynamic atmospheric model is used employing a different exospheric temperature every three months. The drag coefficient is calculated using kinetic theory.

Contract NAS7-100

Physics governing ultrahigh velocity impacts onto dual-plate meteor armor is discussed. Meteoroid shield design methodologies are considered: failure mechanisms, qualitative features of effective meteoroid shield designs, evaluating/processing meteoroid threat models, and quantitative techniques for optimizing effective meteoroid shield designs. Related investigations are included: use of Kevlar cloth/epoxy panels in meteoroid shields for the Halley's Comet intercept vehicle, mirror exposure dynamics, and evaluation of ion fields produced around the Halley Intercept Mission vehicle by meteoroid impacts.

Sponsored by NASA.

Estimation and control methods for a Drag-Free spacecraft are discussed. The functional and analytical synthesis of on-board estimators and controllers for an integrated attitude and translation control system is represented. The framework for detail definition and design of the baseline drag-free system is created. The techniques for solution of self-gravity and electrostatic charging problems are applicable generally, as is the control system development.

Evaluation of Bearing Mounting Design and Excessive Wear Phenomena.
Final Report.
J. W. Kannel. 21 Jun 82, 22p NASA-CR-162053, NAS 1.26:162053
Contract NAS8-33576

The effect of bearing thermal growth on the effectiveness of the bearing preload springs on the space shuttle main engine high pressure oxygen turbopump (SSME HPTOP) were examined. The SSME HPTOP turbine end bearings, preload spring, and bearing mounting design were evaluated relative to spalling, excessive ball wear, possible thermal problems, and cage delamination. The magnitude of the thermal stresses required to cause high levels of ball wear were calculated. Plots of maximum sheer stress and maximum reversing shear versus the axial load for the 57 mm SSME HPTOP bearing were created. A plot of the bearing thermal growth versus preload spring deflection was generated. It was determined that metallic wear, rather than thermal growth, caused enlargement of the contact zone between ball and races, that high fatigue-inducing shear stresses are generated under increased loads, and that at temperatures between 100 and 150 deg C, the springs bottom out and very high loads are developed in the bearing. Allowance for adequate spring movement after assembly is recommended.

The results of an effort to thoroughly and objectively analyze the statistical and historical information gathered during the development of the Shuttle Orbiter Primary Flight Software are given. The particular areas of interest include cost of the software, reliability of the software, requirements for the software and how the requirements changed during development of the system. Data related to the current version of the software system produced some interesting results. Suggestions are made for the saving of additional data which will allow additional investigation.

Effect of a Finite Ionization Rate on the Radiative Heating of Outer Planet Atmospheric Entry Probes.
Final Report.
H. F. Nelson. Jun 82, 69p NASA-CR-3577, NAS 1.26:3577
Contract NAG1-125

The influence of finite rate ionization in the inviscid gas just behind the stagnation shock wave on the radiative heating of probes entering the hydrogen-helium atmosphere of the major planets was investigated. Two opposing conclusions were reached as to how the ionization rate assumption affects the radiative transfer. Hydrogen-helium shock waves with a cold nonblowing wall boundary condition at the probe heat shield are emphasized. The study is limited to the stagnation shock layer.

Index entries in this section are selected to indicate important ideas and concepts presented in a report. When using the keyword index, be sure to look under terms narrower, broader, or related to a particular topic. Although some of the keywords are not selected from a controlled vocabulary of terms, most of them have been selected from the DoD, DoE, NASA, or NTIS controlled vocabularies. The entries are arranged by keyword and then by the NTIS order number.

NTIS®

In this index, the name of the company, university, or government agency that performed the research or prepared the report is listed. Entries are arranged first by the organization's name, then alphanumerically by the performing organization report or series number. If no report or series number is included, the subarrangement is by NTIS order number.

NTIS ORDER/REPORT NUMBER INDEX

NTIS®

Entries in this index list the NTIS order number, the performing organization report number, and the sponsoring organization report number, each in its own alphanumeric position. Although reports may be ordered using only the performing organization report number or the sponsoring organization report number, please use the NTIS order number to order items available from NTIS to ensure faster service. It is best to check the full bibliographic citation in the Reports Announcements section before ordering. Entries are arranged alphanumerically.

Foreign NTIS Cooperating Organizations

NTIS is represented in many countries around the world by local organizations. These representatives ensure NTIS clients in those countries of fast and efficient service when transacting business with NTIS. They offer the convenience of accepting payment in local currencies and, any order-related problem can also be resolved by them. These representatives may also serve as an additional channel for non-U.S. information acquisitions.

NTIS clients in the countries listed below should direct all orders and inquiries to these representatives.
